"Stability of Na(+)-K(+)-ATPase alpha-subunit isoforms in evolution.";

Am. J. Physiol. 259:C619-C630(1990).

-!- FUNCTION: This is the catalytic component of the active enzyme, which catalyzes the hydrolysis of ATP coupled with the exchange of sodium and potassium ions across the plasma membrane. This action creates the electrochemical gradient of sodium and potassium ions, providing the energy for active transport of various nutrients.

-!- CATALYTIC ACTIVITY: ATP + H(2)O + Na(+)(In) + K(+)(Out) = ADP + phosphate + Na(+)(Out) + K(+)(In).

-!- SUBUNIT: Composed of three subunits: alpha (catalytic), beta and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TIGREAMS; TIGRO1106; ATPASE-IIC_X-K; 1.

C -!- FUNCTION. This is the cattalytic component of the active enzyme,
which catalyzes the hydrolysis of AIP coupled with the exchange of
sodium and potassium ions across the plasma membrane. This action
c creates the electrochemical gradient of sodium and potassium ions,
providing the energy for active transport of various nutrients.
- CATALYTIC ACTIVITY: AIP + H(2)O + M(+)(In) + K(+)(Out) = ADP +
                                                                                                                                                                                          EMBL;

SIMINATIC ACTIVITY: ATP + H(2)O + Na(+)(In)
phosphate + Na(+)(Out) + K(+)(In).
SUBUNIT: Composed of three subunits: alpha
                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: This is the catalytic component of the activation which catalyzes the hydrolysis of ATP coupled with the sodium and potassium ions across the plasma membrane. creates the electrochemical gradient of sodium and poproviding the energy for active transport of various interval.
                                                                                                                                                                                                                      gamma (By similarity).
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to the cation transport ATPA
ATPases). Subfamily IIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mouse cDNA sequences.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or hamarow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                     The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It is part of a dimer linked by the omega amino acid to the omega amino acid in the sequence in AAW19534. The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemocherapy, radiation therapy or bon marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp

                                                                                                                                                                                                               The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transflusions. It can also be used disgnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thrombopoietin receptor; binding peptide; treatment; agon haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.
                                                                                                                                                                                                                                                                                                                                                                                   Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-JUN-1995;

                                                                                                                                                                                                                                                                                        resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                       The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a Ta binding affinity as expressed by an IC50 of no more than about 100 microw. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia
                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, esp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmacologically active peptide conjugate having a reduced tendency towards enzymatic cleavage comprises X and Z, where: (a) X is a pharmacologically active peptide sequence; and (b) Z is a stabilising peptide sequence of 4-20 amino acid units covalently bound to X, where each amino acid unit in the stabilizing peptide sequence, Z being selected from Ala, Leu, Ser, Thr. Tyr. Asn, Gln, Asp, Glu, Lys, Arg, His, Met, Orn, and amino acid units of formula - MH-C(R1)(R2)-C(=0)-(1), where: R1 and R2 are H, 1-6C alkyl, phenyl, and phenyl-methyl, where 1-6C-alkyl is optionally substituted with 1-3 substituted with 1-3 substituted with 1-3 substituted with 1-3 substituted with 1-3 substituted with 1-3 substituted with 1-3 substituted from 1-6C-alkyl, 2-6C-alkyl, and phenyl-methyl are optionally substituted with 1-3 substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted with 1-3 substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted selected from 1-6C-alkyl, 2-6C-alkenyl, and phenyl-methyl are optionally substituted selected from 1-6C-alkyl, 2-6C-alkenyl
                                                                                    Thrombopoietin mimetic

Where (I) is: CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(C2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, CC P3, and P4 = are each independently sequences of pharmacologically active CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, CC c, d, e, and f = are each independently 0 or 1, provided that at least 1 CC cf a and b is 1. The composition can have cytostatic, antiasthmatic, CC compositions and invention can be used for producing pharmaceutical CC compositions. The compositions are useful for treating cancer, asthma, CC compositions or autoimune diseases. The use of an Fc domain (rather than CC apab domain) can provide a longer half-life or incorporate functions Such as Fc receptor binding, protein A binding, complement fixation, and CC possibly placental transfer. AAA69443 to AAA69526 and AAB19555 to CC AAB18003 represent nucleotide and amino acid sequences used in the

                                                                                                                                                                                                                                              RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC cells with effective amounts of peptides and peptide mimetics attached to CC hydrophilic polymers. The methods are used to treat thrombocytopenia such CC as that due to chemotherapy, radiation therapy or bone-marrow CC transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders CC including thrombocytopenia and prevent haematological disorders cas unique tools for understanding the biological role of thrombopietin CC (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living CC cells and fixed cells, in biological fluids, in tissue homogenates, and CC in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed compounds or in conjunction with additional cytokines
                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           07-JUN-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC antianaemic, anorective, antiinfertility, haemostatic, dermathological and cc neuroprotective activities. (I) can be used as a therapeutic or c prophylactic agent as well as for screening purposes. (I) is useful for cdiagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of composing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of composing diseases, the presence of their composins of interest in a biological sample. Additionally, (I) is useful cor treatins of interest in a biological sample. Additionally, (I) is useful cor treatins of interest in a biological sample. Additionally, (I) is useful cor freundatoid arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases, tumour growth, cancer, commetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing compounds are useful for treating conditions that involve an existing compounds are useful for treating conditions that involve an existing compounds are useful for treating conditions that involve an existing compounds are useful in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 compounds are conditions and and nucleic acid sequences used in the careful for treating careful acid sequences used in the careful for treating careful acid sequences used in the careful for treating careful acid sequences used in the careful for treating careful acid sequences used in the careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating careful for treating care
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                      and a composition for targetting an adenoviral vector. A system comprising a cell having a non-native cell-surface receptor, and a virus having a non-native ligand which binds the non-native cell-surface receptor of the cell is useful for propagating a virus and also for assaying gene function. The system is also useful for isolating a nucleic acid encoding a product comprising a desired property. Further the system is useful for identifying functionally related coding sequences. Adenoviral vector comprising a non-native nucleic acid encoding a therapeutic agent such as anti-tumour agent, preferably tumour necrosis factor and a second non-native nucleic acid encoding an agent that facilitates imaging and a targetting agent is useful for treating an animal. The therapeutic agent can be used to treat cancer of the brain, lung, ovary, breast and prostate. The present sequence is human non-native ligand attached to an adenoviral vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            therapy; anti------ovary; breast; prostate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention discloses a variant of an immunoglobulin (Ig) variable care heavy or light chain domain that comprises at least one complementarity consists that complementarity controls are consisted as a consistion of the CDR. The CDR calso has added or substituted to it, at least one binding sequence which is heterologous to the CDR and is an antigenic, agonistic sequence from a combination of the CDR, and it is an antigenic, agonistic sequence consists and the CDR, and it is an antigenic. The antigenic sequence consists agonistic sequence and combination of each. The variant or thrombopoietin coll sequence, a T-helper cell sequence, a B-helper cell sequence, a B-helper cell sequence, a B-helper cell sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells sequence, a B-helper cells particularly platelet progenitor cells. The variants are also consisted for treating or preventing haematopoietic or immune disorders cells, particularly platelet progenitor cells. The variants are also consisted for the creating or preventing haematopoietic or immune disorders consisted progenitions comprising the synthebodies can be used for the mobilisation, amplification and ex vivo expansion of stem cells and committed precursor cells for autologous and allogeneic transplantation cells and committed precursor cells for autologous and allogeneic transplantation cells for sensence presented is the TDO recentor (MDI) accorder in reported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of thrombopoietin (TPO) mimetic peptide AF12505, which mimics the activity of recombinant TPO. The invention provides antibody targeting compounds that are used to reprogram the specificity of an antibody. The antibody targeting compound is linked to the combining site of the antibody, such that the modified antibody takes on the binding specificity of the targeting agent. In an example from the invention, a TPO receptor targeting antibody agent. In an example from the proportion of the targeting antibody accompound was prepared by covalently linking peptide AB12505 to aldolase monoclonal antibody 38C2. The TPO receptor targeting antibody compound can be used to treat thrombocytopaenia resulting from chemotherapy and bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody targeting compound useful e.g. for diagnostic immunoassays treating microbial diseases comprises targeting or biological agent covalently linked to combining site of the antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-OCT-2001; 2001US-0344614P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC binds to the c-mpl (mpl) receptor, and which stimulates the production of platelets to the c-mpl (mpl) receptor, and which stimulates the production of disclosed is a composition of matter (II) that binds to an mpl receptor, and a pharmaceutical composition comprising (II) and a carrier. The CC and a pharmaceutical composition comprising (II) and a carrier. The CC platelets in a patient. The TMP of the invention is useful for treating CC conditions involving a megakaryocyte and/or platelet deficiency, e.g. CC disease conditions involving thrombocytopaenia such as aplastic anaemia, CC autoimmune thrombocytopaenia, drug induced immune thrombocytopaenia, autoimmune thrombocytopaenia, and for invention is useful for component of the viability or storage life of platelets and/or megakaryocytes and its derived cells. The compounds demonstrate an cC improved ability to bind to and/or trigger transmembrane signal through, i.e. activating, the mpl receptor the compounds have superior chromobopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of compounds also exhibit compounds also exhibit superior therapeutic properties, such as improved plasma half-life, compounds also exhibit superior therapeutic properties, such as improved plasma half-life, compounds also exhibit such as a trivity and in vivo circulation time. The current sequence compounds also exhibit such as improved plasma half-life, compounds also exhibit such as a trivity and in vivo circulation time. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The method comprises providing a prokaryotic host cell carrying a nucleic acid encoding the recombinant protein operably linked to a promoter functional in the prokaryotic cell, culturing the host cell under conditions where the recombinant protein is expressed, and recovering the recombinant protein is recovered in multimeric form without performing a scaffold refolding step. The protein is useful for treating systemic lupus erythematosus. The present sequence represents a thrombopoietin agonist peptide, which is used to produce fusion proteins of the invention.
                                                                                                                                                                                                                                                                   Increasing hematopoietic stem cell production in subject, usefureducing the incidence of delayed primary engraftment, comprises administering a Thrombopoietin mimetic compound e.g., a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TPO mimetic peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADM72483;

invention relates to a method (M1) for increasing haematopoietic production in a subject which involves administering a production (TPO) mimetic compound to the subject. Also included inher method (M2) of providing haematopoietic stem cells to a subject hinvolves administering a TPO mimetic compound to a subject to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 haematopoietic stem cell; thrombopoietin; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Constitution, and transplanting the harvested stem cells into the subject. Constitution, and transplanting the arbeit of reducing a time to engraftment conformation of stem cells in a subject, involves administering a conformation compound to the subject, enhancing the expansion of the stem cell population within bone marrow and/or mobilizing the stem cells in the peripheral circulation, harvesting one or more of the stem cells in the peripheral circulation, and transplanting the one or more harvested stem cells into the subject. The peripheral circulation and transplanting the one or more harvested stem cells into the subject. The graduction in a subject e.g., human. (M3) is useful for reducing time to congraftment following reinfusion of stem cells, reducing the incidence of delayed primary engraftment, reducing the incidence of secondary failure of platelet production and reducing the time of platelet and/or consutrophil engraftment following reinfusion of stem cells in a subject. (M1) is also useful for increasing the number of stem cells in a subject whose cells are then used for rescue of recipient subject. Also useful in the treatment of thrombocytopenia. (M1) enables transplantation to proceed in patients who would not otherwise be considered as candidates because of unacceptably high risk of failed engraftment, reduces the number of aphereses required to generate a minimum acceptable harvest, reduces the incidence of primary and secondary failure of engraftment by increasing the number of hemanatopoletic stem cells (HSCs) available for transplantation and reduces the time required for primary engraftment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                Thrombopoietin receptor; binding peptide; treatment; agonist; haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia.
                                                Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 14 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  άŠ
                   The invention relates to peptide compounds composed of two peptide chains CC attached to each of the amino groups of a single Lys in the amide form. CC The compounds are of formula (Pepi) (Pep2)K(NH2), where Pepi is of CC formula: X1-1-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC formula: X1-1-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; X1 = H or acyl; X2 CC = Gly or Sar (sarcosine); X3 = Arg, Ala, Nle (norleucine) or N-CC acetyllysine; X4 = Gln or Glu; X5 = Trp, L-1-naphthylalanine or Phe; X6 = CC Ala, 5-aminopentanoic acid or 2-aminobutyric acid; X7 = Ala, CC diphenylalanine, or is absent; X8 = Arg, P- amino-phenylalanine, N-CC diphenylalanine, or is absent; X9, X9' = Ala, beta Ala, N-methyl-alanine, CC are capable of binding to, and activating, the thrombopoietin (TPO) CC are capable of binding to, and activating, the thrombopoietin (TPO) CC are capable of Dro. They may be used as competitive binders in assays CC to screen for new TPO receptor agonists. They may be used as reagents for may may be used as competitive binders in assays CC actoric mby receptors in living capits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity

They may be used to activate TPO receptors in vivo, e.g., to treat blood disorders or thrombocytopaenia associated with bone marrow transfusions, radiotherapy or chemotherapy. The present sequence represents a specific evamenta of
                                                                                                                                                                                                  The present invention discloses an active peptide which promotes thrombocyte generation. The active peptide can be synthesised by a polypeptide solid-phase synthesis method, and has the monomer sequenc IEGPTLRQWILARAC and the amidated peptide chain structure of IEGPTLRQWILARAC-NH2. Its activity is increased by 20 times for its monomer, or by 10 times for the amidated peptide chain compared with monomer, or by 100 times for its dimer compared with its monomer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31-MAY-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombocyte generation promoting peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB20684;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB20684

                                                                                                                                                                       CC bind to and activate the human thrombopoietin receptor (TPO)R). Methods colls with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow contacting the composition polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow contractions and to prevent thrombocytopenia in patients at risk. The concluding thrombocytopenia and platelet disorders. They are used in vitro cas unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO creeptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and conjunctified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed compositions alone or in conjunction with additional cytokines

                                                                                                                                 Ş
                                                                                                                                                            Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods CC of activating thrombopoietin receptors in cells comprise contacting the CC ells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such CC as that due to chemotherapy, radiation therapy or bone-marrow CC transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders CC including thrombocytopenia and platelet disorders. They are used in vitro CC including thrombocytopenia and platelet disorders. They are used in vitro CC including thrombocytopenia and platelet disorders. They are used in vitro CC receptor. The peptides can be used to detect TPO receptors on living CC receptor. The peptides can be used to detect TPO receptors on living CC ells and fixed cells, in biological fluids, in tissue homogenates, and CC in purified or natural biological materials. They may also be used for in Situ staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed committed committed or in conjunction with additional cytokines

CC replaced or fused with biologically active peptides e.g. a peptide comimetic such as an erythropoietin (EPO) or thrombopoietin (TPO) mimetic, that is flanked with proline at its carboxy terminus. (I) has carboxy terminus. (I) has contained to the proliferation, differentiation and maturation of can be used as a stimulator of proliferation, differentiation or growth of containing proliferation, differentiation or growth of contents of the promegakaryocytes or megakaryocytes, which results in increased platelet contents of CDR is replaced with an EPO mimetic, or which has one or control of CDR is replaced with an EPO mimetic, is useful for increasing the production of red blood cells, where (I) is contacted with has made or their progenitors. (I) is useful for diagnostics or therapeutics, in cell populations caused by disease, contacted with hasmatopoietic stem cells or their progenitors. (I) is useful for diagnostics or contacted with hasmatopoietic stem cells or treatments related to the suppression of hasmatopoiesis. (ABO73288 to ABO73377 and ABP51695 to ABD51696 represent sequences used in

                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                          The present sequence is that of thrombopoietin (TPO) mimetic peptide AF12505, modified to include an N-terminal Cys residue. AF12505 mimics the activity of recombinant TPO. The invention provides antibody targeting compounds that are used to reprogram the specificity of an antibody. The antibody targeting compound is linked to the combining site of the antibody, such that the modified antibody takes on the binding specificity of the targeting agent. In an example from the invention, a TPO receptor targeting antibody compound was prepared by covalently linking Cys-modified peptide AB12505 to aldolase monoclonal antibody antibody compound can be used to treat thrombocytopaenia resulting from chemotherapy and bone marrow transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABR62908 standard; peptide; 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody targeting compound useful e.g. for diagnostic immunoassays and treating microbial diseases comprises targeting or biological agent covalently linked to combining site of the antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thrombopoietin; mimetic; thrombocytopaenia; antibody targeting

CC The invention relates to a method (M1) for increasing haematopoietic stem cell production in a subject which involves administering a CC another method (M2) of providing haematopoietic stem cells to a subject canother method (M2) of providing haematopoietic stem cells to a subject compound to the subject to compound to a subject to compound to involves administering a TPO mimetic compound to a subject to compound to a subject to compound to a subject to compound to a subject to compound to a subject to compound to a subject to compound to a subject to compound to a subject to circulation, and transplanting the harvested stem cells into the subject. Involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject, involves administering a compound to the subject and/or more of the stem cells in compounds are disclosed as peptides, including cyclic or modified compounds are disclosed as peptides, including cyclic or modified compounds are disclosed as peptides, including cyclic or modified compounds. In a subject e.g., human. (M3) is useful for reducing the incidence of secondary engraftment following reinfusion of stem cells for reducing the incidence of platelet production and reducing the incidence of secondary failure of platelet production and reducing the incidence of secondary failure of platelet production and reducing the number of stem cells in a subject. (M1) is also useful for increasing the number of stem cells in a subject. On the transplantation to proceed in patients who would not otherwise be considered as candidates because of unacceptably high risk of failed engraftment, reduces the increasing the number of haematopotetic stem cells (H3Cs) available for transplant

```
the bone marrow stem cells or the stem cells in the peripheral circulation, and transplanting the harvested stem cells into the subject. A method (M3) is also provided for reducing a time to engraftment compound to the subject, enhancing the expansion of the stem cells in a subject, involves administering a compound to the subject, enhancing the expansion of the stem cell population within bone marrow and/or mobilizing the stem cells in cells or one or more of the stem cells in the peripheral circulation, harvesting one or more of the bone marrow stem cells or one or more of the stem cells into the subject. The cells or one or more disclosed as peptides, including cyclic or modified peptides. (M1) is useful for increasing haematopoietic stem cell compounds are disclosed as peptides, including cyclic or modified peptides. (M1) is useful for increasing haematopoietic stem cell congraftment following reinfusion of stem cells, reducing the incidence of cells are the production and reducing the incidence of secondary failure of platelet production and reducing the time of platelet and/or cells in also useful for increasing the number of stem cells in a subject. CC whose cells are then used for rescue of recipient subject. Also useful in the treatment of thrombocytopenia. (M1) enables transplantation to
                                                                                                                                                                                                                                                                                                                                                                                                                    cell production in a subject which involves administering a Thrombopoietin (TPO) mimetic compound to the subject. Also included is another method (M2) of providing haematopoietic stem cells to a subject which involves administering a TPO mimetic compound to a subject to enhance expansion of a stem cell population within bone marrow and/or mobbilize stem cells in peripheral circulation, harvesting one or more of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TPO;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
```

cell production in a subject which involves administering a Thrombopoietin (TPO) mimetic compound to the subject. Also included is another method (M2) of providing haematopoietic stem cells to a subject which involves administering a TPO mimetic compound to a subject to enhance expansion of a stem cell population within bone marrow and/or mobilize stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or the stem cells in the peripheral circulation, and transplanting the harvested stem cells into the subject A method (M3) is also provided for reducing a time to engraftment

the subject

얁

The invention relates to a method

(M1) for increasing haematopoietic stem

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC following reinfusion of stem cells in a subject, involves administering a CC TPO mimetic compound to the subject enhancing the expansion of the stem CC cells population within bone marrow and/or mobilizing the stem cells in CC peripheral circulation, harvesting one or more of the bone marrow stem CC calls or one or more of the stem cells in the peripheral circulation, and CC transplanting the one or more harvested stem cells into the subject. TPO CC mimetic compounds are disclosed as peptides, including cyclic or modified CC peptides. (M1) is useful for increasing haematopoietic stem cell credition in a subject e.g., human. (M3) is useful for reducing time to CC engraftment following reinfusion of stem cells, reducing the incidence of CC delayed primary engraftment, reducing the incidence of secondary failure of platelet production and reducing the time of platelet and/or CC (M1) is also useful for increasing the number of stem cells in a subject. (CC (M1) is also useful for increasing the number of stem cells from a donor CC the treatment of thrombocytopenia. (M1) enables transplantation to CC proceed in patients who would not otherwise be considered as candidates because of unacceptably high risk of failed engraftment, reduces the incidence of primary and secondary failure of engraftment by increasing the number of apheroses required to generate a minimum acceptable harvest, reduces the incidence of primary and secondary failure of engraftment by increasing the number of apheroses required to generate a minimum acceptable harvest, reduces the incidence of primary and secondary failure of engraftment by increasing the number of heamatopoietic stem cells (HSCs) available for transplantation and reduces the time required for primary engraftment. CC reference the construction and reduces the time required for primary engraftment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

cc which involves administering a TPO minetic compound to a subject to combilize stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or the stem cells in the peripheral circulation, harvesting one or more of circulation, and transplanting the harvested stem cells into the subject. A method (M3) is also provided for reducing a time to engraftment compound to the subject, enhancing the expansion of the stem cells in a subject, involves administering a compound to the subject, enhancing the expansion of the stem cell population within bone marrow and/or mobilizing the stem cells in cell population within bone marrow and/or mobilizing the stem cells in cells or one or more of the stem cells in the peripheral circulation, and transplanting the one or more harvesting one or more of the bone marrow stem cells or one or more of the stem cells into the subject. TPO transplanting the one or more harvested stem cells into the subject. TPO transplanting the one or more harvested stem cells into the subject. TPO cells or one or more disclosed as peptides, including cyclic or modified comparatiment following reinfusion of stem cells into the subject. TPO cells engraftment following reinfusion of stem cells in a subject. Cells are then useful for increasing the time of platelet and/or cells are then used for rescue of latelet and/or cells in a subject. The present stem cells from a donor the treatment of thrombocytopenia. (M1) enables transplantation to cell considered as candidates because of unacceptably high risk of failed engraftment, reduces the incidence of paraftment by increasing the number of stem cells from a considered to generate a minimum acceptable harvest, cells present sequence represents an example of TPO mimetic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietin (TPO) mimetic compound to the subject. Also included is another method (M2) of providing haematopoietic stem cells to a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   administering a Thrombopoietin mimetic compound e.g., a peptide to

TPO mimetic peptide fragment. 17-JUN-2004 (first entry)

TPO; haematopoietic stem cell; thrombopoietin; haemostatic; stem cell therapy; HSC; transplantation; engraftment; mimetic

Synthetic. Modified-site Location/Qualifiers

/note= "Ly8 (15) is 1 peptide through the a copy of the peptide (group" linked to one copy of the TPO mimetic alpha amino group and to a second (not shown) via the omega amino

                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                 CC Thrombopoietic (TPO) mimetic compound to the subject. Also included is another method (M2) of providing haematopoietic stem cells to a subject to which involves administering a TPO mimetic compound to a stubject to combilize stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or the stem cells in the peripheral circulation, and transplanting the harvested stem cells into the subject. CC A method (M3) is also provided for reducing a time to engraftment CC following reinfusion of stem cells in a subject, involves administering a CC TPO mimetic compound to the subject, enhancing the expansion of the stem CC ll population within bone marrow and/or mobilizing the stem cells in CC peripheral circulation, harvesting one or more of the stem cells into the subject. TPO mimetic compounds are disclosed as peptides, including cyclic or modified CC production in a subject e.g., human. (M3) is useful for increasing haematopoietic stem cell comparatiment following reinfusion of stem cells, reducing the incidence of delayed primary engraftment, reducing the time of platelet and/or neutrophil engraftment following reinfusion of stem cells in a subject. (M1) is also useful for increasing the number of stem cells in a subject. CC whose cells are then used for rescue of recipient subject. Also useful in the treatment of thrombocytopenia. (M1) enables transplantation to proceed in patients who would not otherwise be considered as candidates concerns the incidence of paraftment by increasing the number of aphereses the incidence of necessary and secondary failure of engraftment by increasing the number of haematopoletic stem cells (HSCs) available for reduces the incidence of primary and secondary failure of engraftment by increasing the number of haematopoletic stem cells (HSCs) available for transplantation and reduces the time required for primary appraftment.

CC the bone marrow stem cells or the stem cells in the peripheral circulation, and transplanting the harvested stem cells into the subject.

CC A method (M3) is also provided for reducing a time to engraftment compound to the subject, involves administering a following reinfusion of stem cells in a subject, involves administering a feel population within bone marrow and/or mobilizing the expansion of the stem cell population within bone marrow and/or mobilizing the stem cells in cells or one or more of the stem cells in the peripheral circulation, harvesting one or more of the bone marrow stem cells or one or more or more harvested stem cells into the subject. TPO cells or one or more harvested stem cells into the subject. TPO cells or one or more harvested stem cells into the subject. TPO cells or one or more harvested stem cells into the subject. TPO cells or one or more harvested stem cells into the subject. TPO cells or one or more peripheral circulation, and cells or one or more harvested stem cells into the subject. TPO cells or one or more cells or increasing haematopoietic stem cell cells production in a subject e.g., human. (M3) is useful for reducing time to cell subject e.g., human. (M3) is useful for reducing time to cell subject or of platelet production and reducing the time of platelet and/or cells in a subject. (M1) is also useful for increasing the number of stem cells in a subject. (M1) is also useful for increasing the number of stem cells in a subject. Cells are then used for rescue of recipient subject. Also useful in the treatment of thromboytopenia. (M1) enables transplantation to compose cells in a subject and/or cells in cells in a subject. CC C
CC cell production in a subject which involves administering a subject which involves administering a recompound to the subject. Also included is CC which involves administering a TPO mimetic compound to a subject to a subject combilize stem cells in peripheral circulation, harvesting one or more of the bone marrow stem cells or the stem cells in the peripheral CC circulation, and transplanting the harvested stem cells into the subject. CC A method (M3) is also provided for reducing a time to engraftment CC following reinfusion of stem cells in a subject, involves administering a CC cell population within bone marrow and/or more of the subject. TPO mimetic compound to the subject, enhancing the expansion of the stem cells or one or more of the stem cells in the peripheral circulation, harvesting one or more of the stem cells in cells or one or more of the stem cells in the peripheral circulation, and transplanting the one or more of the stem cells in the peripheral circulation, and transplanting the one or more harvested stem cells into the subject. TPO mimetic compounds are disclosed as peptides, including cyclic or modified peptides. (M1) is useful for increasing haematopoietic stem cell congraftment following reinfusion of stem cells, reducing the incidence of the subject e.g., human. (M3) is useful for reducing time to
